

Success Story

An International Airline Company

Airline Counter Flight Check-in System

Product	MOXA C168H/PCI
Country	United States
Industry	An International Airline Company

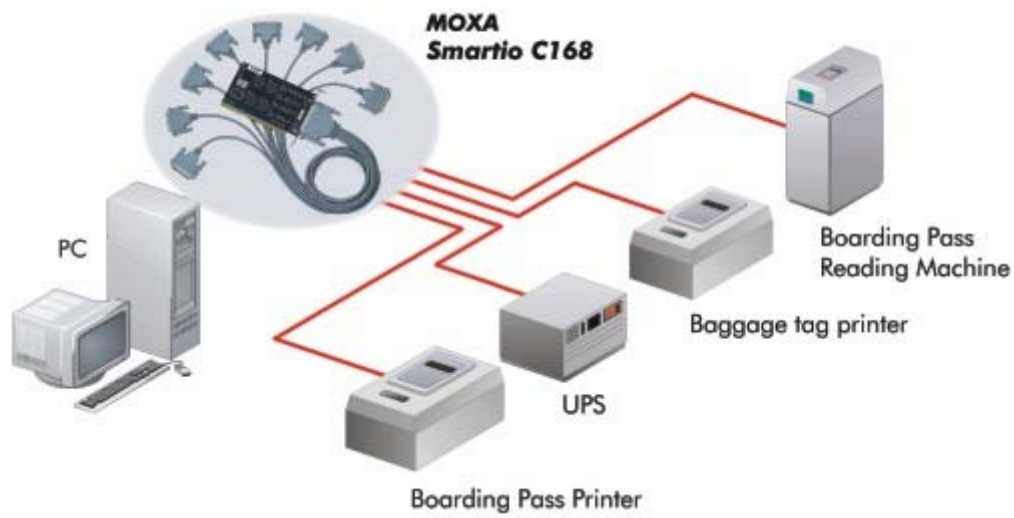

Solution

This airline company has incorporated more than 10,000 MOXA Smartio C168H/PCI multiport boards into their check-in counter system. In this way, they are able to connect many of their important serial devices, such as baggage tag printers, boarding pass printers, and UPS systems, to one computer. The Smartio C168H/PCI boards are used to increase the number of local serial ports controlled by one computer. Once installed, the computer can then be connected to an internal or external network, allowing valuable customer and flight information to be relayed between each station and a central location.

Smartio C168H/PCI was an obvious choice for the airline company. Not only is the product extremely reliable, guaranteeing that the airline company's flight schedule display system will run smoothly and trouble free far into the future, but its compact board size is also a plus, allowing it to fit in virtually any PC. Furthermore, the boards are easy to install and maintain, freeing up valuable time for engineers to accomplish other important tasks.
